

## UNIT - 2

# NATURAL RESOURCES

**RESOURCE** :- A resource is which we will get from the nature to meet our needs and desires

**Classification :-**

1) **Living**

non-living

a) Based on mutability and availability.

Natural Resources

Inexhaustible  
(unlimited)

Exhaustable  
(limited)

immutable

mutable

Maintainable

non-maintainable

Ex:- Atomic power, wind power, Tidal power

Quality cannot be changed

Ex:- Solar power, Hydro power

Renewable

non-renewable

Ex:- Bio-chemical cycle

Ex:- Logs of different species

Reusable

Ex:- Gold, Pt, Al etc

non-reusable

Ex:- Fossil fuels etc

**Inexhaustible** :- It includes unlimited & unending resources  
It is of two types

1) **immutable** - Both quantity & quality of resource is same

2) **Mutable** - Quantity is same but quality different

Exhaustible :- It includes limited & non-renewable resources

It is of two types -

1) Maintenance - It depends on the human activities.

It is of two types -

1) Maintainable - It depends on the human activities.

→ It is of two types -

a) Renewable - The resources which can be bring back to the nature

b) Non-renewable - Once gone, no replacement

2) Non-maintainable - Because of their availability they are not maintainable by human

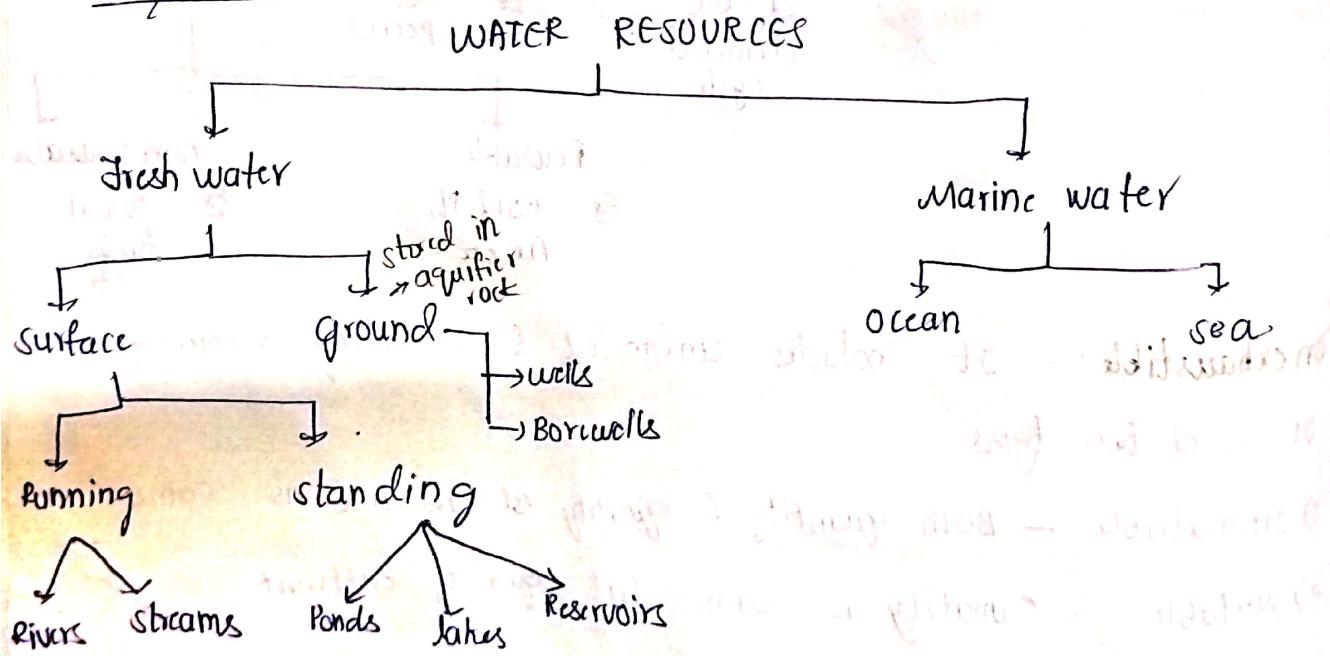

→ It is of two types:-

a) Renewable <sup>usable</sup> - Availability of resource is small and usage is small.

b) Non-renewable <sup>usable</sup> - Availability of resource is small but usage is high.

⇒ Water Resources :-

Classification :-

Uses:-

- 1) Domestic purpose
- 2) Irrigation purpose
- 3) Industrial purpose

Problems:-

- 1) Floods - An overflow of water from water bodies due to insufficient capacity of river channel.

⇒ Causes:-

Natural

- 1) Heavy rainfall
- 2) sudden melting of ice caps
- 3) insufficient capacity of river banks

Man made

- 1) Deforestation
- 2) over grazing
- 3) increasing infrastructure
- 4) roads ways

⇒ Effects:-

- 1) leads to loss of property & population
- 2) increase in unhygienic conditions
- 3) mixing up of drainage water with drinking water
- 4) increase in water-born diseases like Jaundice, cholera, dysentery
- 5) increase in vector born diseases like Malaria, filariasis, Dengue etc.

⇒ Control:-

- 1) Through early warning system.
- 2) By constructing Dams.

DAMS - It is a hydraulic structure used to store the water.

## Types:-

### DAMS

↓  
Based on Material  
(clay + sand + rock)

1) Earthen dams  
(Rock + clay)

2) Rock fill dams

3) Timber (wood)

4) Steel

5) concrete (gravel + cement)

6) Masonry (brick + stone)

↓  
Based on Design

1) Gravity

2) Arch

3) Multiple Arch

4) Butresses

↓  
Based on purpose  
(for energy generation)  
1) overflow

2) Non-overflow

Only for storage  
purposes

## Merits:-

1) Water supply for drinking, irrigation & industrial purposes

2) Hydropower generation

3) Recreation & navigation

## Demerits:-

### 1) Siltation:-

⇒ The deposition of silt in the dams increases load on the river leading to dam failure.

### 2) River load:-

⇒ The deposition of plastic, plant debris and dead bodies of both plants and animals increases the river load and leads to dam failure.

### 3) Reservoir induced seismicity:-

⇒ Sudden earthquakes because of dams.

### 4) Water logging and salinity:-

⇒ Water logging - even though there is a dam the surrounding villages suffer from scarcity of water due to the movement of water table towards dams.

→ salinity - In the coastal areas, the ~~emptied~~ ground water table is filled with saltwater and causes salinity.

5) Displacement of population:-

→ providing rehabilitation or compensation to the people of proposed site.

6) High capital cost -

→ The large scale dams are more expensive.

## DROUGHT

→ The scarcity of water in the soil due to climate change and human activities.

### Causes:-

#### Causes

##### Natural

- 1) Low rainfall
- 2) Late arrival of rain
- 3) Increase in temperature

##### Manmade

- 1) Deforestation
- 2) Overgrazing
- 3) Mining
- 4) Railways
- 5) Industries etc.

### Effects:-

- 1) It leads to unproductive land.
- 2) Loss of vegetation.
- 3) Shortage of food grains.
- 4) Effect on human health.

### Control:-

- 1) Afforestation
- 2) Rain water harvesting
- 3) Implementation of forest conservation act

- Types of Drought:-
- 1) Hydrological drought (low rainfall & desertification)
  - 2) Meteorological drought (late arrival of rain)
  - 3) Agricultural drought (famine - water + food shortage)
  - 4) socio-economic drought - (Reduction of economic status of particular area)

### Mineral Resources:-

⇒ Mineral is a naturally occurring substance having definite chemical composition and identifiable physical properties.

### ORE:-

⇒ It is a mixture of minerals.

Ex:- quartz → gold, Bauxite - Al, Hematite - Fe, Feldspar - Fe

### Classification:-

Mineral Resources			
Metallic	non-metallic	ornamental	liquid
<u>Ex:-</u> Fe, Cu, Al, Mn etc -	<u>Ex:-</u> coal, sand, salt, limestone etc -	<u>Ex:-</u> gold, silver, platinum, gemstone -	<u>Ex:-</u> petrol, Diesel etc.

### Mining:-

- ⇒ The removal of top layer of the soil.
- ⇒ It is of two types:-
- 1) surface mining
  - 2) underground mining

### Process of mining:-

- 1) It is by 4 ways:-
- 1) prospecting - The searching of minerals with the help of geologists and satellites.

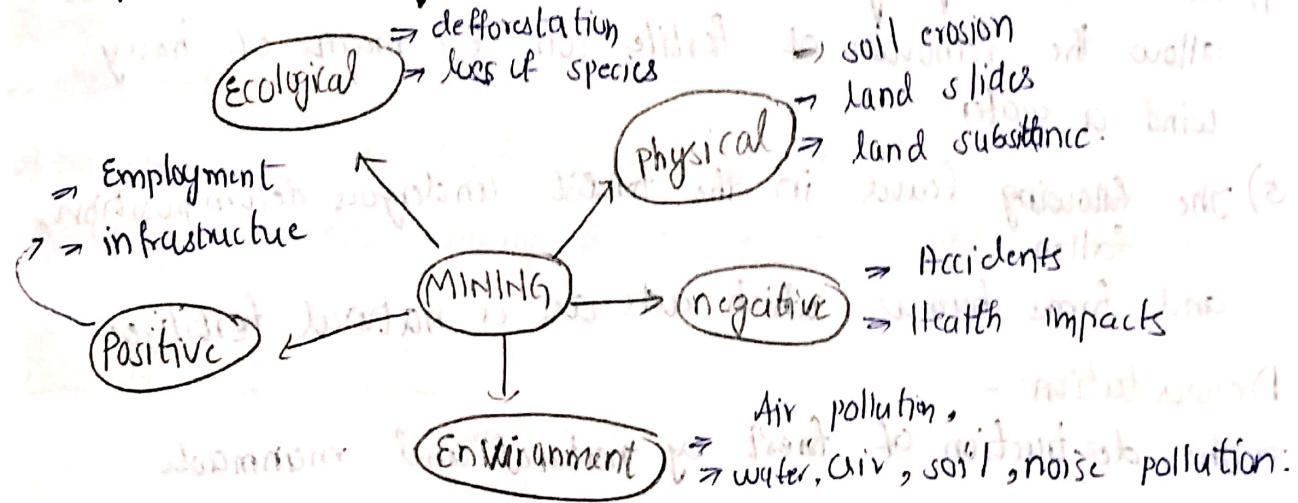

a) Exploration - Assessing the size, shape and economic value of minerals.

b) Proprietary - Mining of minerals along with workers.

c) Development :- Developing the area of mine along with equipment and workers.

d) Exploitation :- The removal of mineral from the earth crust for usage.

→ Impacts of mining on Environment:-

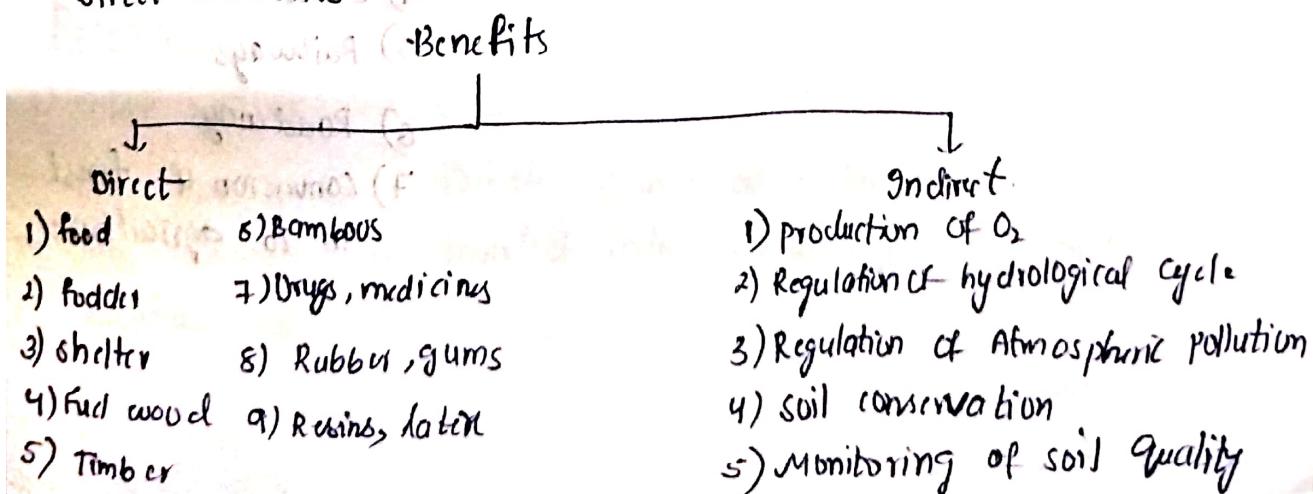

## Forest Resources :-

1) The word Forest is derived from a Latin word *foreis* means outside of village / town

2) Forest is a natural and self sustaining community characterised with vertical structures which constitute the trees.

## Benefits:-

→ Direct benefits and indirect.

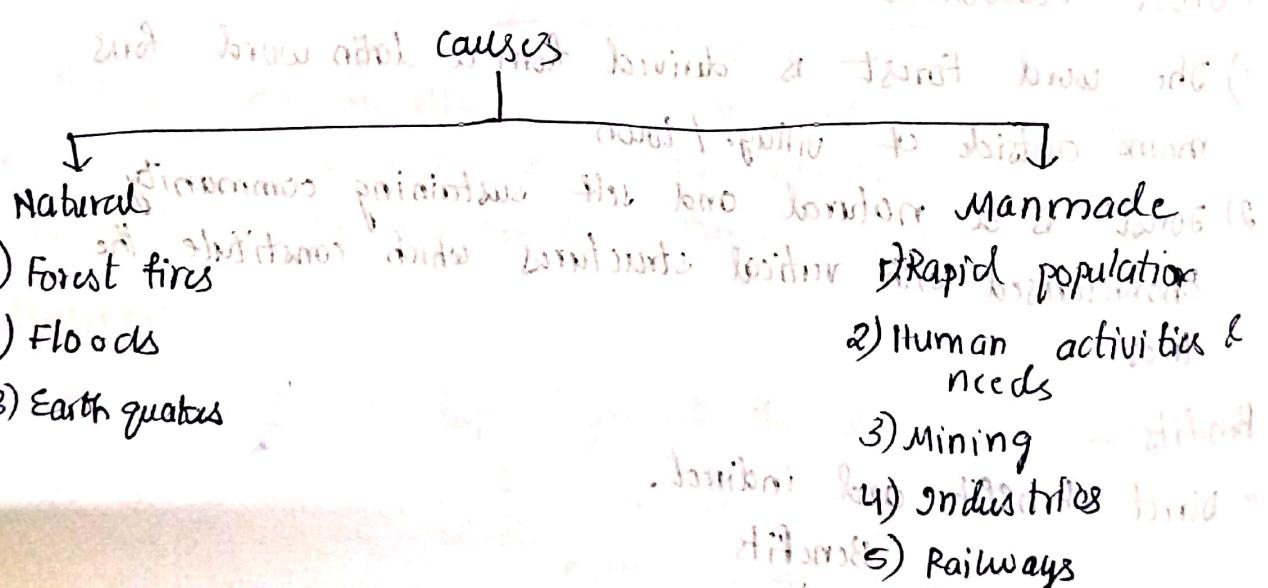

Indirect: -

- 1) plants release O<sub>2</sub> by the process of photosynthesis.
- 2) plants contribute water for the formation of clouds by transpiration and maintains water cycle.
- 3) Plants absorb pollutants like CO<sub>2</sub>, CO, SO<sub>2</sub>, lead (Pb) etc. which reduces atmospheric pollution.
- 4) Plant roots tightly binds the soil particles and does not allow the removal of fertile soil by means of heavy wind or water.
- 5) The fallen leaves in the forest undergo decomposition, and form humus which acts as a natural fertilizer.

Deforestation: -

⇒ The destruction of forest by natural and manmade causes

causes: -

### Effects:-

- ⇒ leads to loss of habitat for wild life
- ⇒ reduction in rainfall
- ⇒ global warming increase and atmospheric pollution
- ⇒ loss of soil fertility.
- ⇒ increase in temperature.
- ⇒ loss of species.

### Control:-

- ⇒ afforestation
- ⇒ implementation of forest conservation act
- ⇒ bringing awareness among the people about forest resources

## ENERGY RESOURCES:-

### Energy resources

#### Renewable

1) solar power

2) wind power

3) Hydro power

4) Tidal power

5) Geothermal energy

6) Bio energy

#### Non-renewable

1) coal

2) crude oil

3) Natural gas

### Renewable

#### 1) solar power:

⇒ The sun is the ultimate source of solar power.

⇒ The sun light is converted into electricity by photovoltaic cell

Photo voltaic cell:-

- It is made up of glass + metal (S) + semi conductors
- The PVC contains two semiconductors,
  - 1) P-Type
  - 2) N-Type which are coated with silicon (or) gallium.
- When the solar radiation is falling on PVC the P-Type semiconductor absorbs and passes to the N-Type semiconductor which is placed at the bottom of PVC, at a particular point there is a formation of P-N Junction which increases electrons flow and converted into electricity.

2. Wind power:-

- In this the wind mills are constructed where the wind is available in the speed of 15km/hr which rotates blades of wind mill and converts the kinetic energy of wind into electricity.

3. Hydro power:-

- In this the water should fall from a certain height on the turbine which converts the kinetic energy of water into electricity.

4) Tidal Power:-

Tide:- It is a result of gravitational pull of sun, moon and earth rotations.

- It is of two types:

- 1) High tide
- 2) Low tide.

High tide:-

→ during high tides the water enters into the tidal barrage and rotates turbines, which converts the kinetic energy of water into electricity.

low tide:-

→ during low tides, the water gets released into the sea from the initial retaining tidal barrage which generates electricity.

5) Geo thermal energy:-

→ the energy is generated from earth crust.

→ In some places the natural geysers and hot springs releases heat in the form of steam by making holes, this steam is trapped by pipe lines and supplied to the turbine, which converts steam into electricity.

6) Bio - Energy:-

→ It is obtained by composting.

→ The decomposition of bio-degradable substances under anaerobic conditions which converts waste into energy.

Non-renewable:-

→ COAL:- It is a solid form of fossil fuel and consists water, carbon, nitrogen, sulphur.

→ It is of 4 types:-

1) Peat (50% carbon)

2) lignite (40% carbon brown coal)

3) Bituminous (60% carbon ~~hard~~ coal)

4) Anthracite (90% carbon hard coal)

Crude oil:- It is a liquid form of fossil fuel formed by the decomposition of micro planktons on the sea bed, rivers, ponds, lakes.

⇒ The fractional distillation of crude oil gives its derivatives at various temperature

3) Natural gas:- It is a gaseous form of fossil fuel and contains 95% of methane, 5% of propane and butane.

⇒ It is a cleanest fossil fuel.

It is also known as town gas. It is a mixture of gases.

It consists of 50% of methane and 40% of propane.

It is obtained from coal gasification or from petroleum.

It is also obtained from natural gas.
